Fundamentals of Machine Learning

Lecture 3: Kernel Regression, Distance Metrics, Curse of Dimensionality

Administrative

- **Assignment 1** will be out Friday!
- It is due **November 1** (i.e. in two weeks).
- It includes
 - Pencil-and-paper derivations
 - Implementing kernel regression
 - numpy/Python code

Movie Recommendation System

- MovieLens dataset (100K ratings of 9K movies by 600 users)
- You may want to split the training set into train and validation (more on this next week)
- The data consists of three tables:
 - Ratings: userId, movieId, rating, timestamp
 - Movies: movieId, title, genre
 - Links: movieId, imdbId, and tmdbId
 - Tags: userId, movieId, tag, timestamp

Recall from last time... Nearest Neighbors

Example dataset: **CIFAR-10**

10 labels

50,000 training images

10,000 test images.

For every test image (first column),
examples of nearest neighbors in rows

- Very simple method
- Retain all training data
 - It can be slow in testing
 - Finding NN in high dimensions is slow
- Metrics are very important
- Good baseline

the data

NN classifier

5-NN classifier

Classification

- Input: X
 - Real valued, vectors over real.
 - Discrete values (0,1,2,...)
 - Other structures (e.g., strings, graphs, etc.)
- Output: Y
 - Discrete (0,1,2,...)

X = Document

Sports
Science
News

Y = Topic

X = Cell Image

Anemic cell
Healthy cell

Y = Diagnosis

Regression

- Input: X
 - Real valued, vectors over real.
 - Discrete values (0,1,2,...)
 - Other structures (e.g., strings, graphs, etc.)
- Output: Y
 - Real valued, vectors over real.

The Martian (2015)  9

PG-13 | 144 min | Adventure, Comedy, Drama | 2 October 2015 (USA)

Your rating: ★★★★★★★★ -/10

8.1 Ratings: **8.1/10** from 271,829 users Metascore: 80/100
Reviews: 750 user | 499 critic | 46 from Metacritic.com

During a manned mission to Mars, Astronaut Mark Watney is presumed dead after a fierce storm and left behind by his crew. But Watney has survived and finds himself stranded and alone on the hostile planet. With only meager supplies, he must draw upon his ingenuity, wit and spirit to subsist and find a way to signal to Earth that he is alive.

Director: Ridley Scott
Writers: Drew Goddard (screenplay), Andy Weir (book)
Stars: Matt Damon, Jessica Chastain, Kristen Wiig | See full cast and crew »

Today

- Kernel regression
 - nonparametric
- Distance metrics
- Linear regression (*more on Friday*)
 - parametric
 - simple model

Simple 1-D Regression

- Circles are data points (i.e., training examples) that are given to us
- The data points are uniform in x , but may be displaced in y

$$t(x) = f(x) + \varepsilon$$

with ε some noise

- In **green** is the “true” curve that we don’t know

Kernel Regression

K-NN for Regression

- Given: Training data $\{(x_1, y_1), \dots, (x_n, y_n)\}$
 - Attribute vectors: $x_i \in X$
 - Target attribute $y_i \in \mathcal{R}$
- Parameter:
 - Similarity function: $K : X \times X \rightarrow \mathcal{R}$
 - Number of nearest neighbors to consider: k
- Prediction rule
 - New example x'
 - K-nearest neighbors: k train examples with largest $K(x_i, x')$

$$h(\vec{x}') = \frac{1}{k} \sum_{i \in k\text{nn}(\vec{x}')} y_i$$

1-NN for Regression

1-NN for Regression

- Often bumpy (overfits)

Figure Credit: Andrew Moore

9-NN for Regression

- Often bumpy (overfits)

Figure Credit: Andrew Moore

Multivariate distance metrics

- Suppose the input vectors $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_N$ are two dimensional:

$$\mathbf{x}_1 = (x_{11}, x_{12}), \mathbf{x}_2 = (x_{21}, x_{22}), \dots, \mathbf{x}_N = (x_{N1}, x_{N2}).$$

- One can draw the nearest-neighbor regions in input space.

$$\text{Dist}(\mathbf{x}_i, \mathbf{x}_j) = (x_{i1} - x_{j1})^2 + (x_{i2} - x_{j2})^2$$

$$\text{Dist}(\mathbf{x}_i, \mathbf{x}_j) = (x_{i1} - x_{j1})^2 + (3x_{i2} - 3x_{j2})^2$$

The relative scalings in the distance metric affect region shapes

Example: Choosing a restaurant

- In everyday life we need to make decisions by taking into account lots of factors
- The question is what weight we put on each of these factors (how important are they with respect to the others).

Reviews (out of 5 stars)	\$	Distance	Cuisine (out of 10)
4	30	21	7
2	15	12	8
5	27	53	9
3	20	5	6

Euclidean distance metric

$$D(x, x') = \sqrt{\sum_i \sigma_i^2 (x_i - x'_i)^2}$$

Or equivalently,

$$D(x, x') = \sqrt{(x_i - x'_i)^T A (x_i - x'_i)}$$

where

$$A = \begin{bmatrix} \sigma_1^2 & 0 & \cdots & 0 \\ 0 & \sigma_2^2 & \cdots & 0 \\ \vdots & \vdots & \cdots & \vdots \\ 0 & 0 & \cdots & \sigma_N^2 \end{bmatrix}$$

Notable distance metrics (and their level sets)

Scaled Euclidian (L_2)

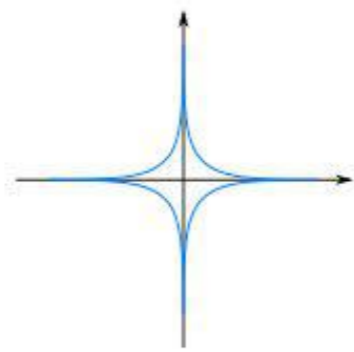

**Mahalanobis
(non-diagonal A)**

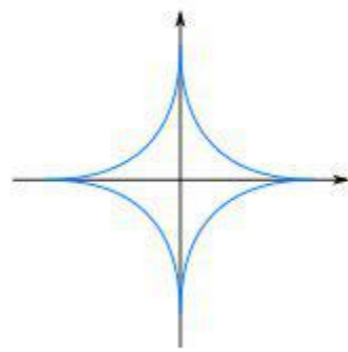

Minkowski distance

$$p = 2^{-2} \\ = 0.25$$

$$p = 2^{-1.5} \\ = 0.354$$

$$p = 2^{-1} \\ = 0.5$$

$$p = 2^{-0.5} \\ = 0.707$$

$$p = 2^0 \\ = 1$$

$$p = 2^{0.5} \\ = 1.414$$

$$p = 2^1 \\ = 2$$

$$p = 2^{1.5} \\ = 2.828$$

$$p = 2^2 \\ = 4$$

...

$$p = 2^\infty \\ = \infty$$

$$D = \left(\sum_{i=1}^n |x_i - y_i|^p \right)^{1/p}$$

Notable distance metrics (and their level sets)

Scaled Euclidian (L₂)

L₁ norm (absolute)

L_{inf} (*max*) norm

Weighted K-NN for Regression

- Given: Training data $\{(x_1, y_1), \dots, (x_n, y_n)\}$
 - Attribute vectors: $x_i \in X$
 - Target attribute $y_i \in \mathcal{R}$
- Parameter:
 - Similarity function: $K : X \times X \rightarrow \mathcal{R}$
 - Number of nearest neighbors to consider: k
- Prediction rule
 - New example x'
 - K-nearest neighbors: k train examples with largest $K(x_i, x')$

$$h(\vec{x}') = \frac{\sum_{i \in knn(\vec{x}')} y_i K(\vec{x}_i, \vec{x}')}{\sum_{i \in knn(\vec{x}')} K(\vec{x}_i, \vec{x}')}$$

Kernel Regression/Classification

Four things make a memory based learner:

- **A distance metric**
 - Euclidean (and others)
- **How many nearby neighbors to look at?**
 - All of them
- **A weighting function (optional)**
 - $w_i = \exp(-d(x_i, query)^2 / \sigma^2)$
 - Nearby points to the query are weighted strongly, far points weakly. The σ parameter is the Kernel Width. Very important.
- **How to fit with the local points?**
 - Predict the weighted average of the outputs
predict = $\sum w_i y_i / \sum w_i$

Weighting/Kernel functions

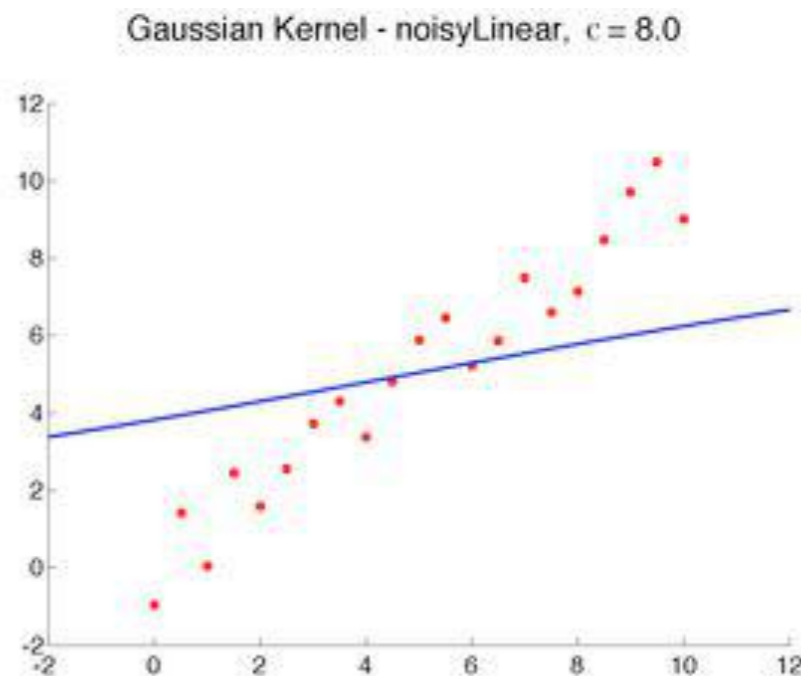

$$w_i = \exp(-d(x_i, \text{query})^2 / \sigma^2)$$

(Our examples use Gaussian)

Effect of Kernel Width

- What happens as $\sigma \rightarrow \text{inf}$?
- What happens as $\sigma \rightarrow 0$?

Problems with Instance-Based Learning

- Expensive
 - No Learning: most real work done during testing
 - For every test sample, must search through all dataset
 - very slow!
 - Must use tricks like approximate nearest neighbour search

Problems with Instance-Based Learning

- Expensive
 - No Learning: most real work done during testing
 - For every test sample, must search through all dataset
 - very slow!
 - Must use tricks like approximate nearest neighbour search
- Doesn't work well when large number of irrelevant features
 - Distances overwhelmed by noisy features

Problems with Instance-Based Learning

- Expensive
 - No Learning: most real work done during testing
 - For every test sample, must search through all dataset
 - very slow!
 - Must use tricks like approximate nearest neighbour search
- Doesn't work well when large number of irrelevant features
 - Distances overwhelmed by noisy features
- Curse of Dimensionality
 - Distances become meaningless in high dimensions

Curse of Dimensionality

- Consider applying a KNN classifier/regressor to data where the inputs are uniformly distributed in the D -dimensional unit cube.
- Suppose we estimate the density of class labels around a test point x by “growing” a hyper-cube around x until it contains a desired fraction f of the data points.
- The expected edge length of this cube will be $e_D(f) = f^{1/D}$.
- If $D = 10$, and we want to base our estimate on 10% of the data, we have $e_{10}(0.1) = 0.8$, so we need to extend the cube 80% along each dimension around x .
- Even if we only use 1% of the data, we find $e_{10}(0.01) = 0.63$. — **no longer very local**

Parametric vs Non-parametric Models

- Does the capacity (size of hypothesis class) grow with size of training data?
 - Yes = Non-parametric Models
 - No = Parametric Models
